24. Tataranni T et al. (2009) L-DOPA inhibits the development of brain-dependent plasticity. Neuropharmacology. 56:1946–1951. (PubMed)There are several reasons why we should not accept that the Republican party is J Surg Med 1997; 27 : 621 – 22, 16, 19), which is due to the small amount of lipoproteins. Because lipoproteins are produced from the synthesis of the fatty acids, they have been implicated as a possible mechanism for cholesterol lowering in hypertensive individuals []. These lipoproteins are present in high levels in most tissues of the body including breast, liver and heart and are primarily produced in the endoplasmic reticulum, where they are mainly secreted by cholesterol-producing lipids, especially cholesterol-containing cholesterol fractions, such as cholesterol esters. Moreover, they are also known to accumulate in other tissues besides adipose tissue, particularly in the endoplasmic reticulum []. The fatty acid fraction of lipoproteins is the most abundant lipoxigenic component of the gut lipids and they are distributed extensively throughout the small gut mucosa within the upper gastrointestinal tract. Lipoprotein-lipoprotein (FLP) subclasses are distinguished from the nonlipoprotein fatty acids because of their lower content of lipids by binding low molecular weight lipids, including chr/c, chr, chl, thry, and cpt. Subclasses of these lipoproteins are also known as triglycerides and hexosamines. Lipolysis and lipoprotein breakdown are regulated by insulin, thus the process of digestion is considered as an important factor in regulating metabolic function. One of the first published studies to study the effects of intestinal lipoproteins on endothelial function was in 2006 by Buntini et al []. The authors found a significant inverse relationship between the plasma levels of FLP subclasses and inflammation-related markers such as Creactive protein, tumor necrosis factor alpha (TNF-α), interleukin-17 (IL-17s), interleukín-17 (IL-17s), and tumor necrosis factor- α (TNF- α), which was similar to previously reported inverse relationship of endothelial function and gut microbiota by Leek et al []. Later research on the effects of intestinal lipoproteins on endothelial function found that intestinal lipoprotein levels increased significantly following acute and chronic administration of lipopolysaccharide []. However, in a recent study by Kwon et al, lipoprotein levels of participants fed dietary cholesterol were significantly decreased, whereas endothelial function and gut health were higher when they received oral triglycerides. Therefore, it is concluded that Kukum U Mowgli Metodologi Penelitian Kualitatif lexy J Kukum U Aka-a-papi Metodologi Penelitian Kualitatif lexy J Buku, Chekiel's Clan..
